Software and Workflow for Reproducible Research

Garret Christensen\(^1\)

\(^1\)UC Berkeley: Berkeley Initiative for Transparency in the Social Sciences
Berkeley Institute for Data Science

Annual Meeting, December 2015
What are practical tools to implement reproducibility solutions?
Problems

- Data not available
- Code not available/unintelligible
- Code and data cannot reproduce original results
Even with the help of the original author (yourself?), you can’t get the data to reproduce the published results. Or you just can’t find the data to begin with.

- *Journal of Money, Credit, and Banking* Project. (Dewald et al., AER 1986)

- Martin Feldstein on Social Security and private savings, Reinhart and Rogoff on debt and GDP growth.
Reproducible Workflow

- Literate Programming
- Version control
  - Github
  - OSF
- Dynamic Documents
  - R Markdown and R Studio
  - Ketchup in Stata
- Data Sharing
  - Harvard’s Dataverse
First, *programming* is key to reproducibility. Working in Excel is not reproducible.

See Reinhart and Rogoff “Growth in a Time of Debt” controversy:

- Original Paper, *AER P & P* 2010
- *New Yorker* summary.

Random number generation in Excel–set seed with Data Analysis Toolpak.
If you are using SPSS, use of ‘syntax’ to record all the commands you run is simple. (See UCLA tutorial.) Similarly in Stata, ‘commandlog’.

Better is to write scripts. R, Stata, SAS, Python, or whatever you please.

Open source has some advantages (being free, for one) but you’re going to use what everyone in your field uses.
Second, *literate programming* is key to reproducibility. Write code to be read by a human being, with the code for the computer secondary.
“I believe that the time is ripe for significantly better documentation of programs, and that we can best achieve this by considering programs to be works of literature. Hence, my title: “Literate Programming.”

Let us change our traditional attitude to the construction of programs: Instead of imagining that our main task is to instruct a computer what to do, let us concentrate rather on explaining to human beings what we want a computer to do.

(cont.)
“The practitioner of literate programming can be regarded as an essayist, whose main concern is with exposition and excellence of style. Such an author, with thesaurus in hand, chooses the names of variables carefully and explains what each variable means. He or she strives for a program that is comprehensible because its concepts have been introduced in an order that is best for human understanding, using a mixture of formal and informal methods that reinforce each other.”

Organizing and Recording Workflow

“Reproducibility is just collaboration with people you don’t know, including yourself next week”

—Philip Stark, UC Berkeley Statistics
Practical coding and organizational suggestions

- Making any changes to a file that has been posted/shared means it gets a new name.
- Use version commands to ensure others get same results.
- Keep a daily research log.
Using version control (AKA revision control) can help to make your work more reproducible.

What is version control?

Version control is a system that records changes to a file or set of files over time so that you can recall specific versions later. For the examples in this book you will use software source code as the files being version controlled, though in reality you can do this with nearly any type of file on a computer.

—Git, About Version Control
Using version control (AKA revision control) can help to make your work more reproducible.

—Git, About Version Control
Version Control

With version control you can:
- Collaborate
- Track who made every change
- Easily switch between versions of files
- Compare versions of files
- Backup
- Work with the same files on different machines
- Experiment with a new version of code without breaking things

  (-THE NUMBER OF ELEPHANTS HAS TRIPLED IN THE LAST SIX MONTHS!)
Version Control

Places you’re already using version control without knowing it:

- Google Docs
- Wikipedia
- Every piece of software you use.
Isn’t this just a complicated version of the “date and initial” method?

- regressions2015.08.24.do
- regressions2015.08.25.do
- regressions2015.08.25GC.do
- Hassle
- Confusion
Version Control

*Here is a good rule of thumb: If you are trying to solve a problem, and there are multi-billion dollar firms whose entire business model depends on solving the same problem, and there are whole courses at your university devoted to how to solve that problem, you might want to figure out what the experts do and see if you can’t learn something from it.*

…

*Not one piece of commercial software you have on your PC, your phone, your tablet, your car, or any other modern computing device was written with the “date and initial” method.*

This is Git. It tracks collaborative work on projects through a beautiful distributed graph theory tree model.

Cool. How do we use it?

No idea. Just memorize these shell commands and type them to sync up. If you get errors, save your work elsewhere, delete the project, and download a fresh copy.
Examples

GitHub and OSF Examples:

- Slides for this workshop on Github.com
- Slides also available on the Open Science Framework
- [https://osf.io/7pbm5/](https://osf.io/7pbm5/)
Even if you write perfect (version controlled) code, you can still run into problems going from your code to paper. This is where dynamic documents come in.

A dynamic document includes your data, code, analysis, and output all in one place. Fully automated, you can guarantee no mistakes from copying and pasting.

Do this with R Markdown in R Studio or Markdoc in Stata.
Even if you write perfect (version controlled) code, you can still run into problems going from your code to paper. This is where *dynamic documents* come in.

A dynamic document includes your data, code, analysis, and output all in one place. Fully automated, you can guarantee no mistakes from copying and pasting.

Do this with R Markdown in R Studio or Markdoc in Stata.
Dynamic Documents

- Include tables by linking to a file, instead of a static image.
- Include number by linking to a value calculated by an analysis file, instead of a static number typed manually.
- Automatically update tables and numbers.
- Produce entire paper with one or two clicks.
Examples

- R Studio Example
- Stata Example
Simple tools exist to help you transparently and reproducibly take your research from beginning to end.

- Version Control
- Open Science Framework
- Dynamic Documents
- Trusted Public Data Archive
