Reimagining Scholarly Communication

Brian Nosek

Center for Open Science

&

University of Virginia

These slides: <https://osf.io/tfnh5>

Past publishing on paper is partly responsible for current dysfunction in the research culture.

Part 1. How we got here

Scholarly communication from 1960s to 1990s (abridged)

Conduct research

Write a paper

Mail four copies of the paper to journal

Journal mails reviewers, reviewers mail journal, journal mails author

Revisions, copyediting, and proofing by mail

Journal gathers papers into issues, prints, mails to subscribers

Non-subscribers visit library for access

Consequences of paper based review and communication

Only conduct peer review for publication when the research is done

Only review the paper, not other research output (data, materials, code)

Only reviewed by a few people, selected ad hoc

Only reviewed in one way -- holistically

Dichotomous decision -- accepted or rejected

Opaque process and decision for readers

Permanent and unrevisable

Part 2. Why it is bad

Paper based
scholarly review and
communication

Evaluation of
individual scholarship

Reward system for
scholars

Impact on knowledge
production

Physical papers

Outcome based

Ad hoc reviewers
Only holistic
Dichotomous
Opaque
Unrevisable

Novel, positive, tidy results
No data, materials, code, process assessment
Dichotomous, unreliable, opaque, discrete rewards

Low credibility research
Weak self-corrective processes
Unreliable and invalid reward systems
Predatory journals, paper mills, fraud

Impediments to evolving the system: Inertia, system justification, publisher business models, risk and uncertainty aversion

Doing credible research is hard.

Publication signals credible research.

Paths to achieve publication with less effort:

- Lack of transparency
- Questionable research practices
- Selective reporting

- Predatory journals (no peer review)
- Fraud (no research)
- Paper mills (no work at all)

Researchers doing credible research could benefit from a system change

ABSTRACT

We estimated the degree to which language used in the health/epidemiology literature implied causality using language linking exposures to outcomes and action recommendations; examined disconnects between language and recommendations; identified the most common linking phrases; and estimated how public

from 18 high-profile journals (65 per journal) published from 2010–2019. Based on written framing and systematic guidance, 3 reviewers rated the degree of causality implied in abstracts and full text for exposure/outcome linking language and action recommendations. Reviewers rated the causal implication of exposure/outcome linking language as none (no causal implication) in 13.8%, weak in 34.2%, moderate in 33.2%, and strong in 18.7% of abstracts. The implied causality of action recommendations was higher than the implied causality of linking sentences for 44.5% or commensurate for 40.3% of articles. The most common linking word in abstracts was “associate” (45.7%). Reviewers’ ratings of linking word roots were highly heterogeneous; over half of reviewers rated “association” as having at least some causal implication. This research undercuts the assumption that avoiding “causal” words leads to clarity of interpretation in medical research.

EVALUATIONS

SERVICE	SUMMARY	VERSION	DATE	EVALUATED
 DataSeer	Found 3 of 4 datasets shared	1	4 May 2023	 
 Review COMMONS	Recommended by 3 reviewers	4	1 Aug 2024	   
 Review COMMONS	Recommended by 1 reviewer	2	15 Jun 2022	

When is it done?

Author assigns a Version of Record (VOR), or not

Is it more burdensome?

Unknown.

Hypothesis: When rewards are achieved with rigor, production will decrease more than evaluation burdens increase.

Will it count?

Meet Current Reward System

Smith, J. A., Smyth, K. B., & Smythe, L. C. (2024). Shared evolutionary origins of nectarines, sauerkraut and Mr. Bean. *Lifecycle Journal*. DOI: [lj0001232.v4](https://doi.org/10.10001232.v4)

Will it count?

Meet Current Reward System **and Offer More**

Vision for *Lifecycle Journal*

We envision a community-led, transparent, continuous amalgam of human, machine, and empirical assessments of the process, outputs, and outcomes of scholarly research across the research lifecycle to promote openness, rigor, credibility, and self-correction in knowledge production.
